## CONTENTS

### Section 1: Infrastructure

Geodetic surveying of railway objects <i>L. Bitterer &amp; S. Hodas</i>	3
Rail head and wheel profile geometry measurement <i>J. Madejski &amp; J. Grabczyk</i>	13
Software for railway track irregularity correction using heavy tamping machine <i>M. Kamiyama, A. Yoshimura, A. Furukawa &amp; T. Mori</i>	23
Optimisation of length of transition curves with vehicle reaction taken into consideration <i>B. Kufver &amp; E. Andersson</i>	33
In-vehicle application of the "RECTIF" system for curve alignment optimization <i>A. Macedo, F. Parente &amp; E. Arsénio</i>	43
Computer aided railway engineering <i>G.A. Fries &amp; J. van Sprakelaar</i>	53

### Section 2: Safety Critical Systems

Safety assessment of Copenhagen driverless automatic mass transit system <i>P. Wigger &amp; U. Haspel</i>	63
Falls on track detection in public transport by artificial vision <i>L. Khoudour &amp; J.L. Bruyelle</i>	73
Obstacle detection in front of automatic trains by linear stereo vision <i>D. Dooze, L. Khoudour &amp; C. Vieren</i>	83
Use of computer databases to manipulate safety information <i>K. J. Watson</i>	93
Developing standards for new technology signal systems for rail transit applications <i>A. F. Rumsey</i>	103

Using formal methods for quality assurance of interlocking systems <i>L.-H. Eriksson &amp; K. Johansson</i>	113
Safety case production <i>J. Allan, J. Williams, G. Gander-Miller, M. Turner, T. Ballantyne &amp; J. Harvey</i>	123
The role of independent safety assessment in managing project risks for new or modified programmable electronic systems for railways <i>J. Catmur &amp; M. Harrison</i>	133
<b>Section 3: Planning</b>	
Use of computers in planning and execution of infrastructure investment <i>M.G. Reynolds</i>	149
The impact of passenger capacity analysis on station design <i>P. Clifford</i>	159
The TDG application: an highly interactive tool for railway timetable planning and traffic monitoring <i>S. Benoliel, S. Betgé-Brezetz, G. Bain &amp; G. Ménapace</i>	167
The GCOST™ Model for demand estimation <i>N.G. Harris</i>	177
Railway line capacity planning support model <i>M. Jelaska</i>	187
Application of computer simulation to rail capacity planning <i>W. M. Barter</i>	199
<b>Section 4: Systems Engineering and EMC</b>	
Towards a complete systems engineering environment <i>J.M. Wise &amp; J. Allan</i>	215
The application of systems engineering tools on London Underground <i>G. Wheeler, S. Fielding &amp; A. Hooper</i>	225

System engineering approach for London Underground Year 2000 compliance <i>G. Digby &amp; J. Horan</i>	235
A systems approach to solve the locomotive and signalling EMC problem <i>B.M. Steyn &amp; J.D. van Wyk</i>	245
Systems engineering and systems integration – the West Rail approach <i>P.M. Anderson, C.S. Chang, E.C.S. Kwok &amp; L.K. Siu</i>	257
<b>Section 5: Scheduling and Freight Car Distribution</b>	
Systems integration and organisational choice <i>R. Haugen</i>	269
Crew operation scheduling based on simulated evolution technique <i>K. Kataoka &amp; K. Komaya</i>	277
CREWS: a train scheduling tool <i>E.M. Morgado &amp; J.P. Martins</i>	287
Improving the Dutch railway services by network-wide timetable simulation <i>J.S. Hooghiemstra, D.M. Middelkoop &amp; M. J.G. Teunisse</i>	299
DYNAMIS: a model for the calculation of running times for an efficient time-table construction <i>A. Radtke, L. Müller &amp; A. Schumacher</i>	309
Ad-hoc planning of timetables for accidents or maintenance sites <i>M. Hesselfeld &amp; V. Klahn</i>	319
Development of intelligent crew roster management system <i>H. Shibata &amp; E. Iwasaki</i>	329
The max-plus algebra approach to railway timetable design <i>R.M.P. Goverde</i>	339
Designing container yard management systems <i>M. Paolucci, V. Recagno &amp; S. Saccone</i>	351
Empty freight car distribution at Swedish State Railways <i>M. Joborn</i>	361

Investigation of shunt operation performance of jointless track circuits using a specialised track circuit computer simulation tool <i>R.J. Hill &amp; M. L. Berova</i>	371
--	-----

## **Section 6: Vehicle Dynamics and Fatigue**

Shape optimization analysis for corrugated wheels <i>M. Akama, T. Kigawa &amp; E. Kimoto</i>	383
Simulation of severe wheel-rail wear <i>Z.-L. Li &amp; J.J. Kalker</i>	393
Simulation of acoustical properties of rail cars <i>U. Danneskiold-Samsøe</i>	403

## **Section 7: Power Supply and Traction**

A study to estimate effective coefficient of regenerative energy in electric railway <i>T. Sugimoto</i>	413
TTS/SIMON Power Log – a simulation tool evaluating electrical train power supply systems <i>A. Nyman</i>	427
The result of simulation on response of a pole with a string applied at the top end to vibrational force applied to its base <i>Y. Kawanaka &amp; T. Morikawa</i>	437
Mechatronic engineering as one facet of CAPE <i>R. Schreiber &amp; C. Zeidler</i>	447
Simulation and analysis of current distribution on DC electric multiple-units with bus line <i>Y. Shimodaira &amp; T. Morikawa</i>	459
Evaluation of power feeding systems for regenerative trains <i>M. Ashiya, M. Yasuda &amp; S. Sone</i>	469
Computer aided design tool for the study of electric traction fixed installations and train operation <i>L. Cunha, N. Henriques, J. Esteves &amp; J. Santana</i>	479

Short circuit analysis for traction power supply system of new concept guided busway <i>A. Del Naja, V. Galdi, L. Ippolito &amp; A. Piccolo</i>	489
Statistical and probalistic methods applied to dc traction system supply <i>S. Bertini, M. Fracchia, M. Garbero, A. Mariscotti &amp; L. Pierrat</i>	501
<b>Section 8: Traffic Control</b>	
Delay analysis for train operation <i>C.K. Lee</i>	513
Simulation of the operation of personal rapid transit systems <i>J.E. Anderson</i>	523
Malmaban traffic simulations: investments and capacity allocation <i>M. Wahlborg</i>	533
An analytical model for the calculation of the capacity of lines, junctions and station tracks <i>L. Florio &amp; L. Mussone</i>	543
Results of the implementation of an optimal control system in an integrated control centre for metro lines <i>A. Fernandez, F. de Cuadra &amp; A. Garcia</i>	553
Computer-aided methods for railway operation conflict solving <i>S. Betge-Brezetz, S. Benoliel, G. Bain &amp; G. Menapace</i>	563
An optimal traffic regulation method for metro type railways based on passenger oriented traffic evaluation <i>S. Murata &amp; C.J. Goodman</i>	573
An evaluation of algorithms and systems for Computer-Aided Train Dispatching <i>P. Hellström, B. Sandblad, I. Frej &amp; A. Gideon</i>	585
Constraint programming for real-time train circulation management problems in railway nodes <i>J. Rodriguez &amp; L. Kermad</i>	597
State of the art computer application to railway traffic control and automation <i>G. Sciutto &amp; G. Astengo</i>	607

Centralised traffic control centres <i>M.V. Neto</i>	617
Automatic conflict detection and advanced decision support for optimal usage of railway infrastructure: purpose and concepts <i>A. Stolk</i>	629
Locomotive asset management: integration of GPS, mobile telemetry and GIS technologies <i>J. Eilenberg &amp; T. Crane</i>	639
Modelling and simulation of the European Train Control System for test case generation <i>H.-M. Schultz, M. Meyer zu Horste, B. Ptak &amp; E. Schneider</i>	649
Modelling and simulation of the European Train Control Satellite based locating for guided traffic <i>S. Röver, M. Schroeder &amp; E. Schneider</i>	659
A model for schedule optimisation in an intercity transport system <i>F. Russo</i>	669
<b>Section 9: Maintenance</b>	
Computerisation of rail vehicles maintenance systems <i>P. Zvolensky, V. Stuchly &amp; J. Grencik</i>	683
Computer aided maintenance systems for railway applications <i>G.F. D'Addio, P. Firpo &amp; S. Savio</i>	693
Communications and control system for fleet maintenance management of the DBAG locomotive BR101 <i>K. Gemmeke, F. Kock &amp; E. Koopmann</i>	703
Remote control monitoring into the next millennium <i>C. Roberts &amp; S. Fararooy</i>	715
Designing a maintenance tool for high-speed signalling <i>F. Lefebvre, J. Rodriguez &amp; S. Piechowiak</i>	723
ECOTRACK: a tool for track maintenance and renewal managers <i>R.E. Rivier</i>	733
Electronic interlocking maintenance using modern computers <i>F. Costa</i>	743

## Section 10: Ticketing

- Contactless smart card AFC trials in East Japan Railway 753  
*S. Miki, T. Takai & S. Tsujimaki*
- The concept and a trial operation of multipurpose electronic ticket in Japan 761  
*A. Hachiga, I. Hattori & Y. Yazu*

## Section 11: Multi Train Simulators

- Hybrid Petri nets as a new formalism for modelling railway systems 773  
*G. Decknagel & E. Schneider*
- A multi-train movement simulator with moving block signalling 783  
*M.T.K. Ho, B. Mao & Y. Yang*
- A train operating method with real-time adaptability to performance variations of rolling stock 793  
*T. Nagata, S. Murata, Y. Naka, O. Sakashita & N. Shimizu*
- Experimental validation of propagation models for radiocommunications applications in industrial environments 805  
*M.V. Castro, A. Seoane, F.P. Fonatan & J. Pereda*

## Section 12: Pantograph and Catenary

- PANDA: a friendly CAD tool for pantograph design and testing 817  
*A. Balestrino, O. Bruno, A. Landi & L. Sani*
- Virtual acquisition system for experimentation in 'Pantograph-Catenary Interaction' 827  
*P. Masini, M. Papi & G. Puliatti*
- Preliminary field testing of a servoactuated pantograph 837  
*M. Papi, M. Rinchi, A. Rindi & P. Toni*
- High speed railways: pantograph and overhead line modelling and simulation 847  
*G. Diana, S. Bruni, A. Collina, F. Fossati & F. Resta*
- Computerised systems for catenary geometry assessment 857  
*A. Fumi*

Dynamic behaviour of pantographs due to different wear situations 869  
*T. Larsson & L. Drugge*

Modelling of electromagnetic emission from  
catenary-pantograph sliding contact 881  
*S. Brillante, P. Ferrari & P. Pozzobon*

Arcing in AC railways: a mathematical approach 891  
*V. Galdi, L. Ippolito & A. Piccolo*

### **Section 13: Human Interface and Decision Support**

Automatic conflict detection and advanced decision support for optimal  
usage of railway infrastructure: prototyping and test results 907  
*F. Makkinga & S. Metselaar*

Information and knowledge – valuable assets used for  
train operation and control 917  
*A. Fay & E. Schneider*

## **Rail head and wheel profile geometry measurement**

J. Madejski & J. Grabczyk

*Silesian Technical University in Gliwice, Poland, Faculty of Mechanical Engineering; P.U.T. "GRAW"*

*E-mail: [graw@david.silesia.pik-net.pl](mailto:graw@david.silesia.pik-net.pl)*

### **Abstract**

Fast and accurate measurement of the profiles of surfaces of rail head, switches, and wheels features an indispensable element of the technological process of their manufacturing and maintenance. Rails are the crucial elements of the track, so requirements regarding their mechanical properties and geometrical accuracy are very high. On the other hand, train wheels have to be checked on a regular basis to make it possible to determine when repair or replacement is needed, due to their excessive wear resulting in improper geometry. All presented results were obtained using the novel handheld gauges developed and field tested by the authors.

### **1 Introduction**

The measurement process of wheel and track geometry is a tedious task, error prone, and requiring skilled staff to be done reliably in the field conditions (Bałuch<sup>1</sup>, Królikowski<sup>2</sup>). Automatic portable devices with a programmable measurement zones, described in the paper, make it

possible to take measurements of the transverse profiles of rail head and train wheels, and log the results for further detailed analysis using the dedicated computer software. Processing of data may be carried out in field conditions using a rugged industrial grade portable or handheld PC computers, or else later in the office environment where the latest measurement data may be compared with previous readings to detect any eventual potentially dangerous trends (P.U.T. GRAW<sup>3-5</sup>). Some of the data collected are required by expert systems assisting track maintenance (Bałuch<sup>6</sup>).

The measurements may be carried out both by the rail and wheel manufacturers in the rolling mills and by the railways personnel inspecting the rails and cars in the track. The paper presents results of the thorough investigations of the track and sample units of the rolling stock operated on it. The results reveal specific details that may add to making the maintenance procedures more specific to the operation conditions investigated - Figure 1.

Rail head profile is a very sensitive feature of the rail - it keeps changing all the time during rolling, straightening, operation in the track, and during its repairs. Rail head shape features a decisive factor affecting the magnitude of contact stresses between the train wheels and the running surface of the rail (Adamiec<sup>7</sup>, Bałuch<sup>8</sup>).

Laser rail head profile measurement gauge is indispensable in many distinct areas - all of them vital for the rail and track quality. According to current standards, customers - railways - must be allowed to verify the rail manufacturing process by the rail manufacturer (Feldman<sup>9</sup>, Richter<sup>10</sup>). As one of the significant rail geometrical factors is the transverse section of the head, the railways' inspectors must have the necessary tools that will permit them to check correctness of the rail profile. The same holds true during commissioning of the rails - certain portion of the batch may be, and should be, carefully checked to confirm the product quality. Rail head profile, albeit a secondary factor when deciding repairs or other corrective measures, should be available to the railways' maintenance services. In certain cases - when third party service providers are called to do the job, e.g. during grinding of the track, it is desirable to be able to verify the quality of the work done (Świderski<sup>11</sup>, Towpik<sup>12</sup>).

Figure 1: Manufacturing and maintenance related decisions requiring information about the rail head and wheel profiles

Profiles of the wheel sets of the rolling stock should be also regularly checked. It depends only on the specific needs if the user needs the full information about the wheel surface profile or only the values of its standardised geometrical parameters. Gauges to satisfy both these needs have been developed. All areas of application of the profile measurement gauges are presented in the scheme above along with some crucial considerations requiring reliable data depicting the rail head and wheel profiles.

## 2 Rail Head Profile Measuring Gauge

Complex rail head shape should be easily and precisely measured both on the manufacturer's shop floor and in the field conditions - on the track. It is essential from the economical- and safety of operation points of view that the decision of grinding the track is made based on sound technological assessment of the track condition after analysis of the results of measurements of rails' straightness and deterioration of the rail head shape. Thanks to the unique design principle, the accuracy of readings collected by the gauge is not affected by precision of the worker carrying out the measurement. In fact, real measurement of the rail head is carried out using a PC system into which all measurement data are downloaded. It is possible to store as much as 70 profiles in memory. Any gauge positioning errors are eliminated at this stage allowing user to take any measurements, perform zooming and annotating of the measured profile (Grabczyk<sup>13</sup>, P.U.T GRAW<sup>14</sup>).

The gauge system consists of the mechanical measuring module, control and data logger module, and the proprietary software. The key element of the gauge is a laser measurement probe travelling around the rail head taking readings of its transverse profile - Figure 2. Whenever geometry of the rail head has to be measured in the track, the gauge is used with the additional measurement base positioning it properly in regard to the other rail of the track. The measurement sector may be freely defined according to the actual needs - its range may incorporate full head shape starting from its fishing surface.

Figure 2: Example of the proper shape of the UIC 60 rail head with the error plot

Figure shows a new UIC60 rail nominal head profile, measured profile and labelled error plot with error values indicated at angular coordinates selected by the user. Note the proper shape of the rail head running surface, slight error of slope of the side surfaces of the rail head is visible. Measurement cycle was about 20 sec, resolution along the rail head is better than 0.5 mm, and resolution in the direction normal to the rail head is better than 0.05mm.

### 3 Wheel Profile Measurement Gauges

#### 3.1 A-B Gauge

The device makes it possible to read the entire profile of the wheel surface both of the wheels on the lathe during the manufacturing process as well as of the wheels mounted on the rolling stock - cars and locomotives. Measurement is carried out by manual guiding the contact tip along the checked surface. All readings are logged in the electronic memory of the gauge which may store as much as 40 profiles. All measurement data is downloaded to the PC computer for processing of measurement data. Dedicated proprietary software is used for visualisation of results, analyses, annotating, and comparing the measured profiles with any reference profiles that might be selected by the user. These include for instance standard wheel shapes or previous measurement results, making it possible to follow wearing out of the working surfaces of the wheels. Once the profile is measured it may be freely zoomed, panned, rotated, and measurements may be made in angular and cartesian coordinate systems - Figure 3. It is possible to determine any dimensions of the profiles, including their  $O_w$ ,  $O_g$ , and  $q_R$  parameters.

A unique application of this software is juxtaposition of the measured rail head profiles and wheel profiles (P.U.T. GRAW<sup>15,16</sup>). This makes it possible to carry out detailed analyses regarding the mechanism of wearing out of the particular surfaces of the mating elements. Measurements may be made of particular profiles, their fragments or superimposed profiles.

Figure 3: Worn out wheel running surface profile; dimensions were added in user selected locations

Figure 4 shows result of measurement of the gap between the rail head and the wheel of the car used on this track. Theoretical and measured profiles are shown along with dimensions of the gap, measured at used selected profile locations.

### 3.2 $O_w O_g q_R$ Gauge

Many applications call for determining  $O_w$ ,  $O_g$ , and  $q_R$  parameters only, disregarding the true wheel profile. This is so in most maintenance applications. Dedicated  $O_w O_g q_R$  gauge is a specialised electronic vernier making it possible to measure these geometrical parameters of the wheel in site and - eventually - store them for further use. The dedicated database system was developed to make it possible to retrieve previous measurement data, compare them, and to output of hardcopy reports (P.U.T. GRAW<sup>17</sup>).

## 4 Recapitulation

Extensive field tests have proven usefulness, reliability and accuracy of the novel measuring devices. They have helped to read the true rail head and wheel profiles which in turn featured an accurate input data for evaluation of the contact stresses between train wheel and the rail running surface. Measuring capabilities of these gauges, give a possibility of describing precisely a true rail head profile, meeting the demands of the European Rail Research Institute. Moreover, measurement of the geometry of working surfaces of switches is also possible using another gauge - not presented in this paper.

**Computers in Railways VI**  
**Series: Advances in Transport - Volume 2**

Computers are now being used in every facet of railway activity from initial feasibility studies to the actual construction of the track and rolling stock, and the ultimate operation of the network.

Following the success of the five previous international conferences on Computer Aided Design, Manufacture and Operation in the Railway and other Advanced Mass Transit Systems, the sixth meeting in the series was convened in Lisbon, Portugal in September 1998. Its purpose was to report on progress in the use of computer-based techniques within the railway industry and other advanced passenger and freight transit systems and to promote a general awareness of these.

Describing how planners, designers, manufacturers and operators can benefit from the latest developments in this area of information technology this book contains the proceedings of the sixth conference. Both underlying technology and environmental issues are covered and topics are divided under the following headings: Infrastructure; Safety Critical Systems, Planning, Systems Engineering and EMC; Scheduling and Freight Distribution; Vehicle Dynamics and Fatigue; Power Supply and Traction; Traffic Control; Maintenance; Ticketing; Multi-Train Simulator; Pantograph/Catenary; Human Interface and Decision Support; Block Signalling and Interlocking and ATC and Signalling Equipment.
